

Avi Patel

Age: 18
Occupation: Unemployed
Location: Mississauga
Income Range: $0 - $300,000

Avi strives to be a software engineer in the future as he studies BSc Computer science at Wilfred Laurier University.

SHORT-TERM GOALS

- To make sure his car runs the same pristine shape all year
- Secure co-op status at Milton campus

TRAITS

- Honesty
- Leadership
- Selfless

FRUSTRATIONS

- When things don't go as planned
- Misunderstandings or lack of clarity in conversations can lead to frustration.

PERSONALITY

- Humble
- Funny
- Kind

INTERESTS

- Soccer
- Music
- Biking

Alexis Creed

Age: 24
Occupation: Doctor (Residence)
Location: Mississauga
Income Range: $200,000 – $600,000

Alex has been a doctor for three years. She is a transfer student from Paris, France who looked to find a better life in Canada.

SHORT-TERM GOALS

- Live her best life
- Make a lot of money
- Find a loyal husband

TRAITS

- Patience
- Problem-solving
- Caring

FRUSTRATIONS

- Dislikes authority
- rude patients
- Hates when people talk a lot

PERSONALITY

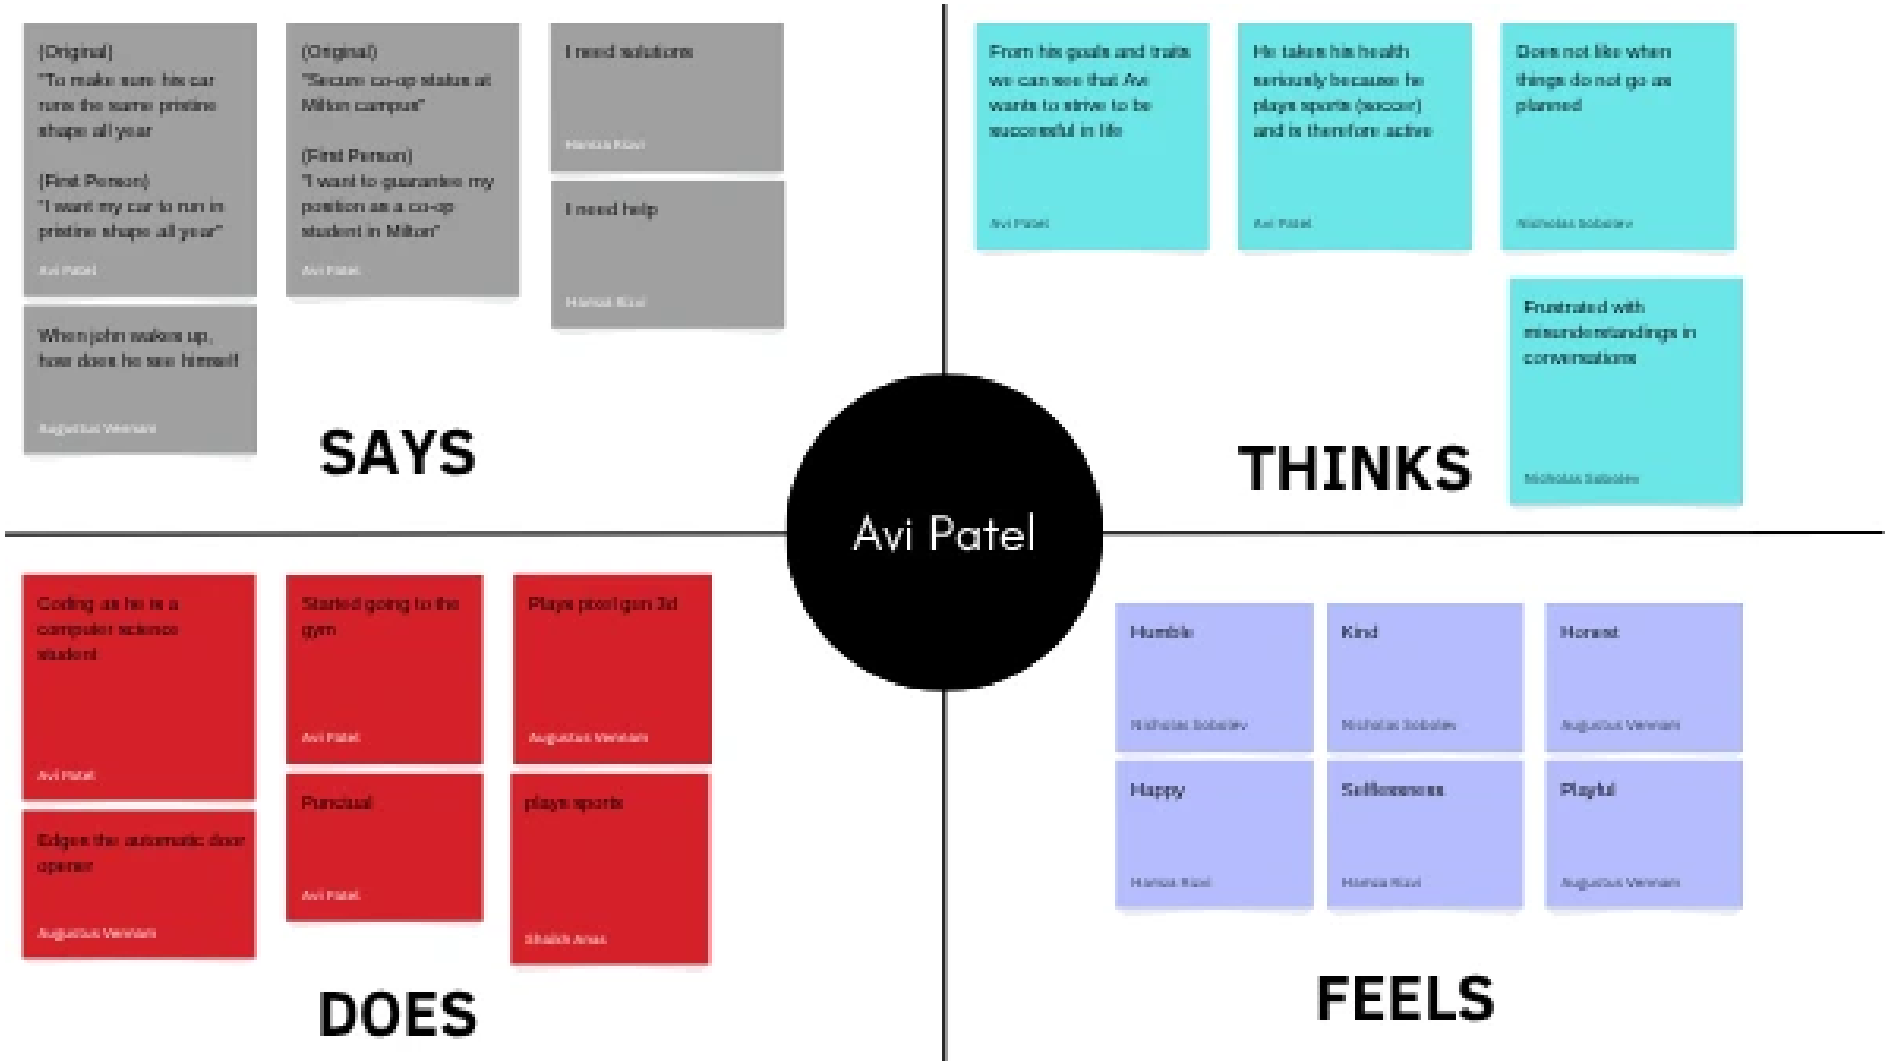

- Caring
- Compassionate
- Loyal

INTERESTS

- Dancing
- Cooking
- Make-up

PERSONA

AVI PATEL

SCENARIO

User has started going to the gym and they want to track their calorie and be more health conscious

USER EXPECTATIONS

Good relaible advice regarding his health

Smooth Browsing and good user experience

PHASE 1 Decision to Use	PHASE 2 Setup Account	PHASE 3 Track Health	PHASE 4 Recieve Feedback
DOING Finding the app from an ad, and downloading it from the app store	Entering in personal information • Height • Weight • Age	Use the built in tracking feature to monitor calories and progress	Use the feedback to gain insights on health
THINKING **How do I get started?** **Will this service keep me in check?**	Is the account free to setup?	"Are my calories monitored properly?" "Is my sleep monitored correctly?"	How can I use the feebaack that the pp has given me to reach my goals? Both short and long term.
SAYING **I need to improve myself** **Need a six pack**	The app is easy to login and start using, follows conventional rules from the conventional industry message	The app tracks my sleep and calories with ease	I need to make changes to my current lifestyle

INSIGHTS

24/7 support significantly increases user satisfaction and retention rates.

Personalized app experiences increase user engagement by up to 74%.

User-generated content in ads increases click-through rates by 50% compared to branded content.

INTERNAL OWNERSHIP

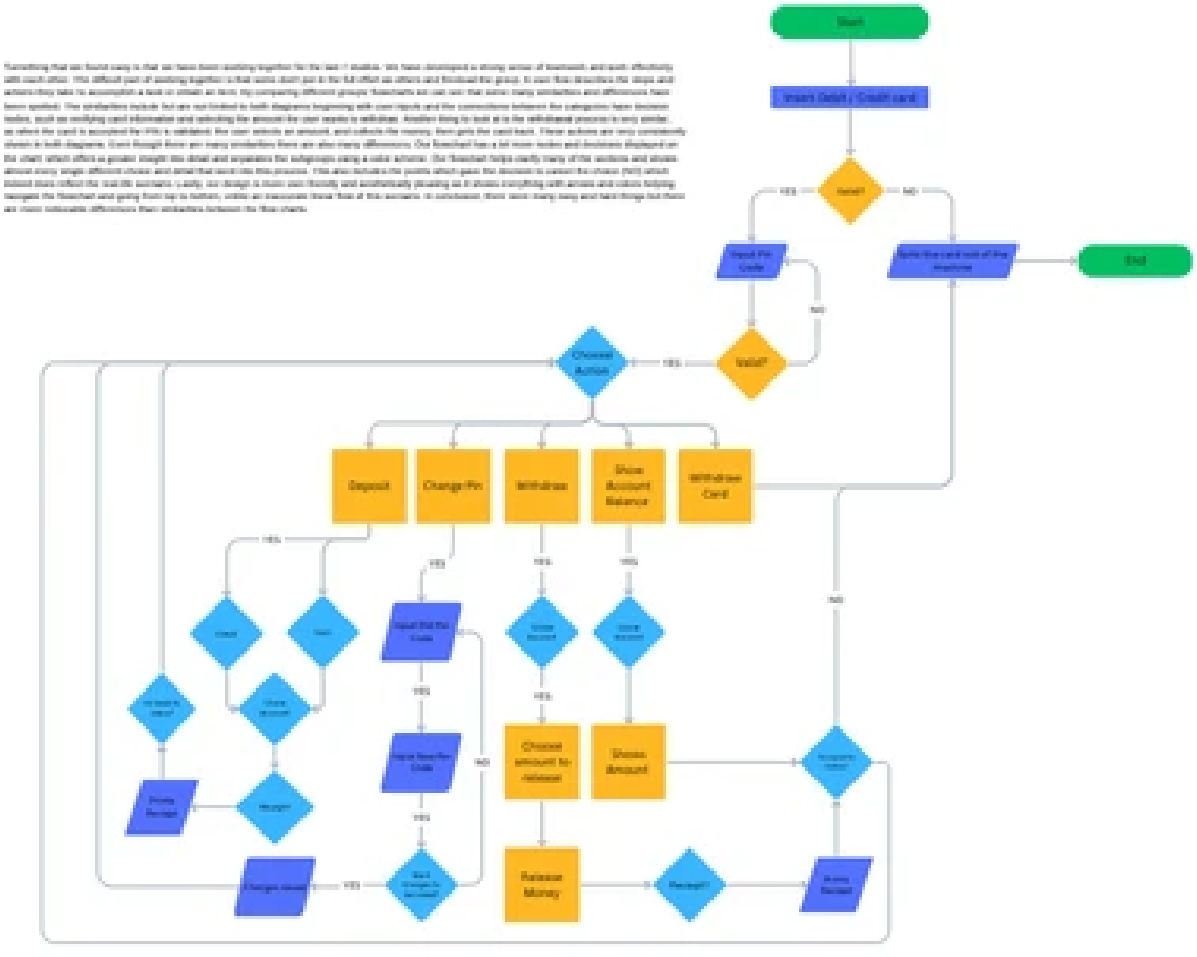

Customer support team work 24/7 to provide assistance and to all customers

The analytics team works to take their users choices to make their experience more personalized

Marketing team starts to heavily advertise on all social media platforms (Instagram, Twitter, Youtube)

Design Principals

1. We aim to give users realistic and accurate data according to their activities
2. We care about the users health; we provide the science and research
3. We want information to be easily accessible, any time, any where

Why

We decided to choose these design principals as it best represents the foundation of the app.

The first design principal focuses on the accuracy of our app, ensuring that users are receiving beneficial information.

The second design principal focuses on why we make sense as a solution. All our app's functions are founded by science and research, giving credibility to our app.

The third design principal focuses on the ease of access. Our app is always available for the user to use, either through their watch or phone. Utilizing functions like notifications, reports and summaries

Creating a Concept

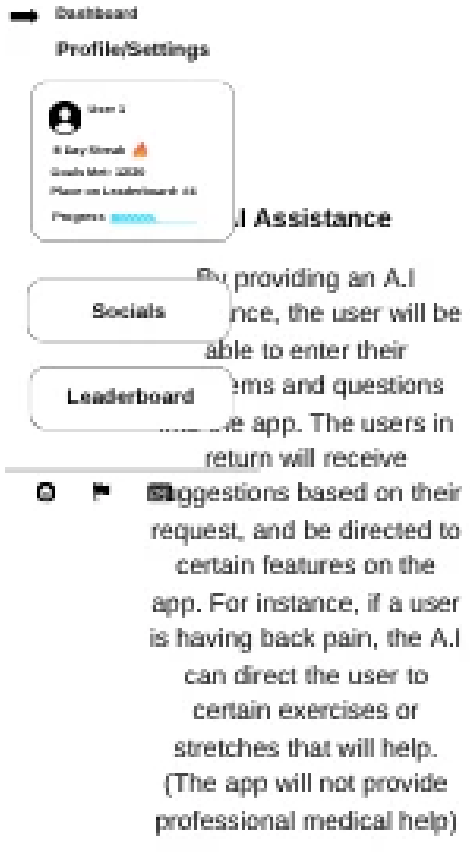

Smartwatch Integration	The user maybe looking for an app that can keep them be productive and healthy while being widely acessable.	This can help the user have ease of access on their wrist and remind them about their plans and goals
Augmented reality support	The user wants to have an app that keeps the user entertained and consistent while achieving their fitness goals.	This can help the user to have a unique experience that can keep them returning and having fun with the app.
Gamification	The user may want a competitive nature to when it comes to working out because they find it motivating to push their limits.	This can help the user to connect with others and have a fun experience while they work toward their fitness goals.
Ai Assistant	The user can ask an AI general questions about their workouts or daily routines and help them improve them.	This can help the user to get general help and insight into a task they are trying to achive.
Reminders	The user may want reminders about their calories, water, and medication intake, etc.	The reminders can help the user stay committed to their plans and meet their goals.
Health report	The user may want a health report to see if they are consistent and achieving the goals that they set for themselves.	The health report can help the user find where they were lacking and provide tips to improve their health.
Fitness Video	The user may be new to working out or want to learn new techniques. Fitness videos can help the user learn the facts about what they are interested in.	This can help the user to find workout plans and different exercises that interest them while having expert guidance from an instructor.

Suggestions by Other Group

Instead of the A.I searching the entire web for results, we will use A.I to only get information from specific well documented resources. This will ensure the information given to the user is accurate, as this is an important aspect especially when it is about a person's health.

This suggestion is also useful as it builds upon the idea of our first design principal which is giving users realistic and accurate data. Using A.I is useful, but if it provides the user with misinformation it can be dangerous especially when it is about their health. Narrowing the resources to only well respected resources will reduce the impact of misinformation.

Constraints:

Smart Watch Integration: Not everyone has access to a smart watch; reducing the use case of our app

Apple Vision: The feasibility of a developer to construct a vision OS app

A.I Assistance: Training and developing AI to have accurate responses takes a lot of time

Gamifying Healthy Habits: Ensuring that gamifying will not take away from the seriousness and main function of the app

Solution :

Smart watch integration: Main focus will be the app and the smart watch integration will be for extra quality-of-life features.

Apple Vision: Hiring people and training them before we hire them to develop the app on vision OS.

A.I Assistance: Use existing A.I that focuses on health and science to use for our app, rather then making or training our own.

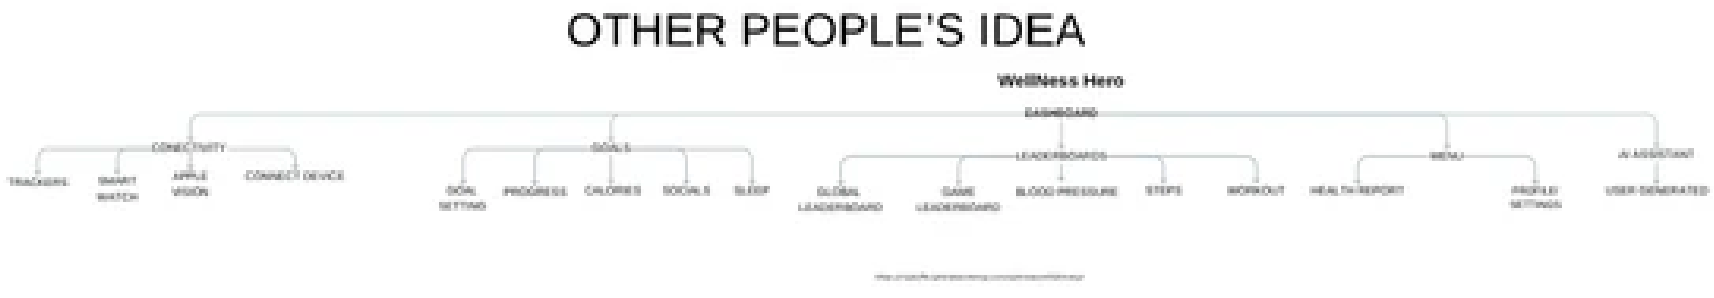

Gamifying Healthy Habits: Make gaming not the main focus of the app by focusing on dense information and statistics based on activity

We believe all our ideas are worth producing as they all serve different purposes for our app that increase its use case. As all four of these are feasible and can make sense. This has almost never been done before in the fitness app industry and can revolutionize the use of technology for fitness.

We applied one Christopher Wicken's principle from each category by avoiding absolute judgement limits, minimizing information access cost, replacing memory with visual information, and through pictorial realism.

Foremost, we avoided absolute judgement by providing multiple ways to understand information. We first implement a numerical and then a visual way of processing data. For example, calories left can be tracked by the number of calories left, or how far the bar is to completing the circle.

Next, we minimize information access cost by implementing shortcut gestures at the bottom of every screen prototype. We additionally, include ease of access buttons for help and to return to the previous page.

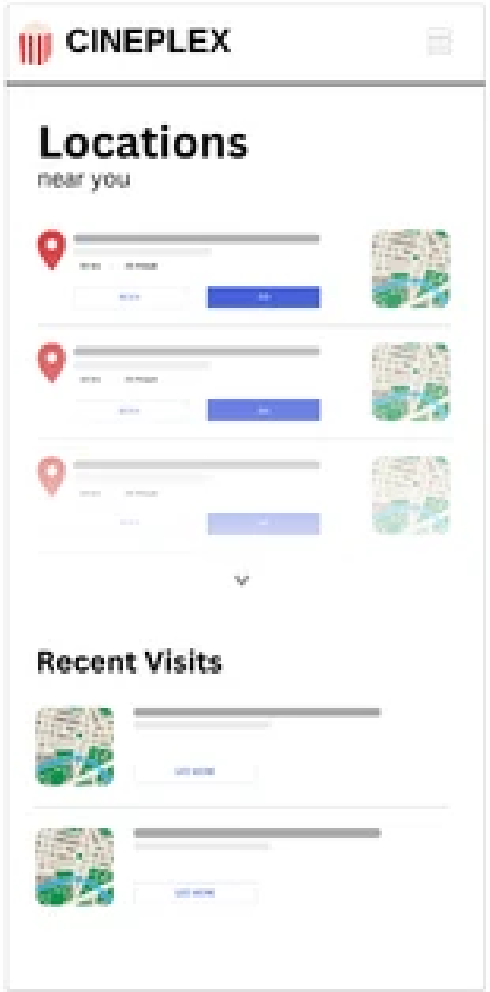

We also replaced memory with visual information by using menus and visual aids to guide the user through our app. For example, the help button is conveniently placed at the bottom of the screen clearly labeled to guide users who are misguided with using the app.

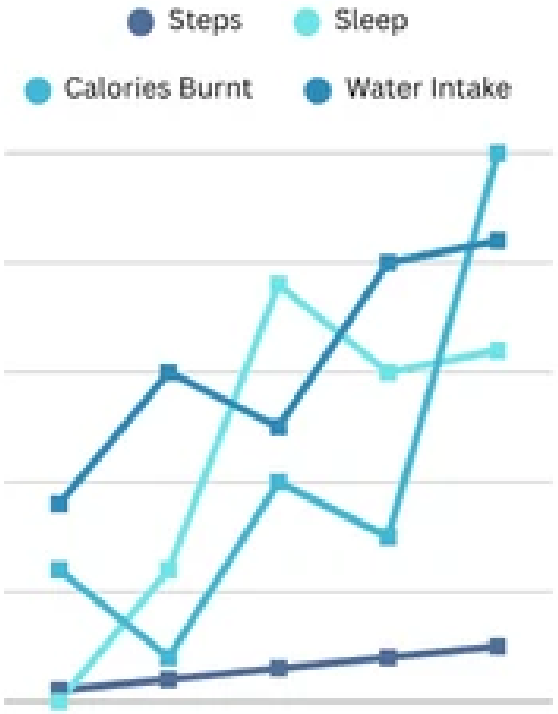

Finally, we use pictorial realism to represent several different things in our app. For instance, the flame is used to represent how much of something is burned (calories). Or the clock is used to represent time spent doing a certain activity. All these icons are repeatedly used for the same thing, so users do not become misguided about its use.
