
The Ghost Squad
UX RESEARCH PLAN
Prepared By:
Hamza Rizvi, Augustus Vennam,
Safdar Md Abdus Shukur, Raeya Sangha

Project Overview

Koenigsegg is a luxury hypercar manufacturer known for innovation, exclusivity, and engineering excellence. Its website serves as a primary digital touchpoint for enthusiasts, potential buyers, journalists, and investors. Despite its strong visual identity, the site may present usability and accessibility challenges for users seeking specific information efficiently.

Our Goal

To evaluate and improve the usability, accessibility, and information architecture of the Koenigsegg website to better support user goals while maintaining the brand's premium image.

Problem Statement

Users may struggle to efficiently find technical specifications, model comparisons, and ownership-related information due to complex navigation, dense content, and a design that prioritizes aesthetics over usability.

Target Audience

- The primary users are people aged 25-65 from all over the world. They have medium to high technical skills, meaning they are comfortable using technology and understanding detailed information. They are mainly interested in automotive engineering and luxury vehicles.
- The secondary users include journalists and researchers who need accurate information for reports and studies. Potential investors use the information to understand trends and opportunities in the automotive industry. General automotive enthusiasts are also part of this group, as they enjoy learning more about cars, technology, and innovations in the field.
- The design should balance luxury branding with clarity, accessibility, and efficiency.

Research Goals

The goal is to identify any usability issues that affect navigation and how easily users can find content on the website. It also aims to understand what users expect when they visit a luxury automotive website, including design, features, and information quality. Another focus is to evaluate whether the website meets accessibility standards and is usable by people with different needs. Finally, the study looks at how users compare different vehicle models and how well they understand and interpret technical data.

These goals will directly inform navigation redesign, content hierarchy, and accessibility improvements.

Research Process

1. Discovery Phase

The discovery phase focuses on understanding the problem space through competitive analysis and user interviews. This helps identify industry standards, strengths, weaknesses, and real user needs.

2. Evaluation Phase

The evaluation phase involves reviewing the design using heuristic evaluation and conducting usability testing to find usability issues and areas for improvement.

3. Validation Phase

The validation phase brings everything together by synthesizing insights from the research. Based on these findings, clear recommendations are made that align with UX best practices.

Research Methods

Manual/Traditional Methods

Manual or traditional methods involve direct interaction and evaluation without automation. User interviews are used to understand user motivations and frustrations. Usability testing focuses on observing real users as they interact with the product to identify issues. Heuristic evaluation assesses the design against established usability principles to find usability problems.

AI-Assisted Methods

AI-assisted methods are used to analyze common patterns across competitor websites. They also help draft clear research questions and support the structuring of research reports to improve clarity and organization. AI will **support**, **not replace**, user research or critical analysis.

Research Deliverables

- **User Personas**
  Describes key user types, their goals, and their needs.
- **Journey Maps**
  Shows the steps users take and highlight their experiences and pain points.
- **Heuristic Evaluation Report**
  Lists usability issues based on established usability principles.
- **Usability Testing Summary**
  Outlines key findings from observing users completing tasks.
- **Insights & Design Recommendations**
  Provides clear takeaways and suggested improvements based on the research.

Timeline

Week	Activity	Deliverable	Deadline
Week 3	Project setup & Plan finalization	Research Plan	Jan 22 (Today)
Week 6	Heuristic Evaluation	Evaluation Report	Feb 12
Week 8	User Interviews	Interview Notes & Data	Feb 26
Week 9	Synthesis of User Data	User Persona & Journey Map	Mar 5
Week 11	Formative Usability Studies	Usability Testing Summary	March 23
Week 13	Reporting & Presentations	Final Research Report Presentation	March 23 – April 2

Tools & Technologies

Research & Collaboration

Discord is used as the main platform for research collaboration and communication. It supports voice meetings, text discussions, and quick sharing of updates, making it easy for the team to stay connected and organized.

Documentation

- **Google Docs** is used for writing and collaborating on research documents in real time.
- **Canva** is used to design clear and visually engaging graphics and layouts.
- **PowerPoint** is used to present research findings and recommendations in a structured slide format.

AI tools

- **ChatGPT** is used for brainstorming ideas and helping structure content.
- **Claude** is used to support writing and summarization tasks.
- **Gemini** is used for additional research support and idea generation.

Team Introduction

Hamza Rizvi

Research Lead

rizv5908@mylaurier.ca

Augustus Vennam

Documentation & Reporting Lead

venn552@mylaurier.ca

Raeya Sangha

Interview Coordinator

sang0312@mylaurier.ca

Safdar Shukur

Usability & Accessibility Lead

shuk5741@mylaurier.ca

Reporting and Sharing

Research Findings Report

- The research findings are shared through a detailed report provided as a PDF.

Stakeholder Presentation

- Key results and insights are also presented to stakeholders using slide presentations.

Visual artifacts

- Visual artifacts such as user personas and journey maps are included to clearly communicate user needs and experiences.

Insights will be communicated through clear summaries, visuals, and actionable recommendations.

AI Usage Statement

This project used generative AI tools ethically and responsibly to assist with brainstorming, document structure, and refining written content. All research decisions, analysis, and conclusions were made by the team.
